

# Anti-aging therapy with botulinum toxin

The injecting of **botulinum toxin (Botox)** is, by far, the best method for removing the wrinkles on the forehead and on the external eye angle.

## ➤ When do we use BOTOX treatment?

Most often, it targets excessive expression wrinkles, visible when a person smiles, laughs or wonders. These wrinkles tend to accentuate significantly in dynamics and will be much less noticeable when the face is relaxed.

## ➤ Who is the right candidate for BOTOX?

The procedure is generally aimed at people aged between 25 and 65. Over this age, wrinkles become static and, in most cases, will not be influenced by the treatment. There is a need for a medical exam for each patient before the procedure to determine whether it suits each patient.

## ➤ How is BOTOX administered?

A small amount of the substance will be injected into the targeted areas with a very small needle, the discomfort being minimal. Most patients compare the sensation to that of a slight sting. No prior anesthesia of the area is required, and daily activities can be resumed immediately after the procedure.

## ➤ Are injections painful?

For these treatments we use needles of very small size, the discomfort being almost non-existent. There may be a slight feeling of pressure or prick, but it disappears very quickly.

## ➤ Are there any side effects of the procedure?

In extremely rare cases local pain of moderate intensity, inflammation, redness and / or mild bleeding may occur.

## ➤ How long are the results seen and how long will they be maintained?

Effects are visible after a period of 3-8 days, and generally last between 3 and 5 months. Often, after a few sessions, the results will last for a longer period.

## ➤ Is there only one treatment session?

A single treatment session is enough to relax the face and remove unsightly wrinkles. For long-term results, regular sessions are recommended at regular intervals, every 5-6 months.

## ➤ What happens when the effects of BOTOX begin to disappear?

When the effects begin to disappear, the wrinkles treated will begin to be visible again, but in most cases, they will not be as deep and visible as before the procedure. After 3-4 treatment sessions, the results begin to persist over a longer period.

## ➤ Is there a recovery period after the procedure?

There is no recovery period, most patients resuming their daily activities immediately after the procedure. However, it is advisable to avoid intense physical effort and massage of the area for 1-2 days.

## ➤ Will I continue to look natural after treatment?

Although wrinkle results will be visible, BOTOX treatment will not radically change the face's expressiveness. The muscles will be relaxed to minimize the appearance of unaesthetic wrinkles, but the expressiveness will remain.

## ➤ I do not want to look artificially. Are the treatments with BOTOX and FILLERS suitable for me?

Surely! Both treatments provide an improved look, while preserving the natural appearance of the face. The facial expression will be preserved. Surgical procedures involve removing excess skin, leaving an unnatural aspect, while both fillers and BOTOX will create a general younger look without an artificial aspect.
